

## Automated Configuration Management

Enforce policies, regulations and security initiatives down to the desktop level.

Many IT professionals are faced with the arduous job of adhering to a broad range of government regulations and a plethora of company policies. Keeping the network compliant to internal and external rules can be an overwhelming and never ending job. The search for the perfect solution has led to a colorful mix of products that may or may not work in all environments.

**Compliance with Government and Company Policies** ANSA Platinum's Configuration Management will allow IT professionals to enforce policies to the desktop and server level through an intuitive web-based interface. The products automation is a big help in making sure that every ANSA-enabled device on the network is compliant. Configuration Management allows for easy reporting and the setting up of rules. A company can utilize the rules provided with the software or customize rules and policies to meet their specific needs.

**Manage down to the Desktop** Desktops, for example can be set up to accommodate an approved list of software. If someone uninstalls any desktop application, Configuration Management will notify IT of the discrepancy. Also if someone installs a program not on the approved list, Configuration Management can uninstall it immediately, again notifying IT. This results in desktops and servers being managed for greater efficiency, security and compliance.

## Uses Fewer IT Resources

ANSA Platinum's Configuration Management requires fewer IT resources, such as time, initial cost, man hours, and the ROI is seen quickly. With a rapid install, this solution is also easy-to-use, and allows IT professionals' a tighter control over their network resources. Compliance is easy to enforce and monitor allowing IT managers to sleep well at night.

## Configuration Management allows IT professionals to:

### Features
